

Only 1% of sand mined for heavy minerals is actually removed from the Island.

Only 1% of the sand mined for heavy minerals on North Stradbroke Island is actually removed from the Island.

That's why Unimin can rehabilitate the sand dunes mined back to their original form.

With a 20 year program of rebuilding the ecosystem on each area mined, Unimin can ensure a Sustainable Stradbroke will be there for generations to come.

**Sustainable
Stradbroke**
